*CO<sub>2</sub> CAPTURE AND STORAGE IN THE CONDITIONS OF THE CZECH REPUBLIC  
"Cooperation of Czech republic and Norway"  
7th – 8th November 2016, Masaryk Dormitory, Prague, Czech Republic*

# CO<sub>2</sub>/H<sub>2</sub>S capture based on solvent methods

- Suitable physical solvents (choice due to high CO<sub>2</sub> / H<sub>2</sub>S content)
- In CCS-IGCC typically considered same method as for desulphurisation
- Several methods and solvents exist:
  - **Selexol** (dimethyl ether of polyethylene glycol)
    - In literature slightly favoured in energy demand
  - **Rectisol (MeOH)**
    - Cheap and commonly available solvent
  - Purisol (NMP)
  - Fluor Solvent (propylene carbonate)
  - Other

# Selecting of solvent method for CO<sub>2</sub>/H<sub>2</sub>S capture

Parameter	Rectisol	Selexol
Regeneration heat	Higher	Lower
Operating temperature	Lower (-20°C)	Higher (room)
Absorption capacity	Higher (Czech lignite has high S content – (1-3%))	Lower
Selectivity H <sub>2</sub> S vs. CO <sub>2</sub>	Lower	Higher
Chemical / thermal stability	Excellent (no degradation)	Limited
Other	No foaming, lower corrosion, lower viscosity, higher solvent loss with product, absorbs H <sub>2</sub> O	
Syngas application in CR	IGCC power plant Vřesová	N.A.

# Rectisol system modelling

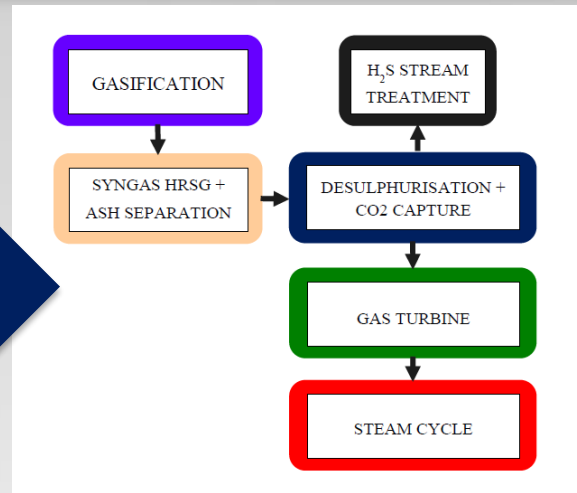

- using Aspen PLUS platform
- properties set based on Peng-Robinson method
- H<sub>2</sub>S removal requirement
  - 30 ppm in syngas requirement (dew point)
  - 100 ppm in CO<sub>2</sub> requirement for transport
- CCR 85% with CO<sub>2</sub> compression to 110 bar
- Realistic equipment efficiency, integration into the model of the whole plant

# Rectisol wash proces

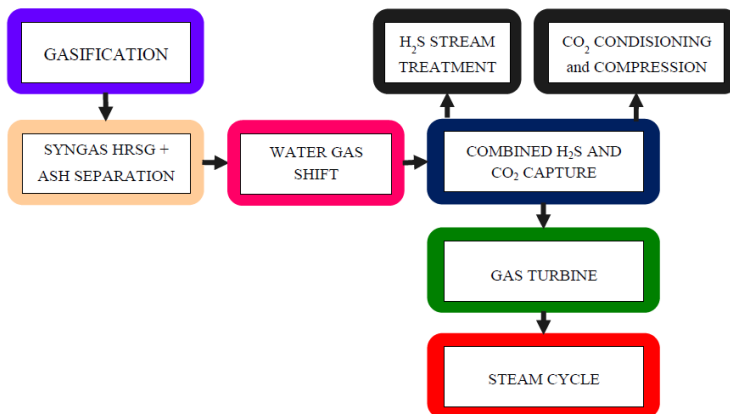

## - Detail of combined H<sub>2</sub>S and CO<sub>2</sub> capture

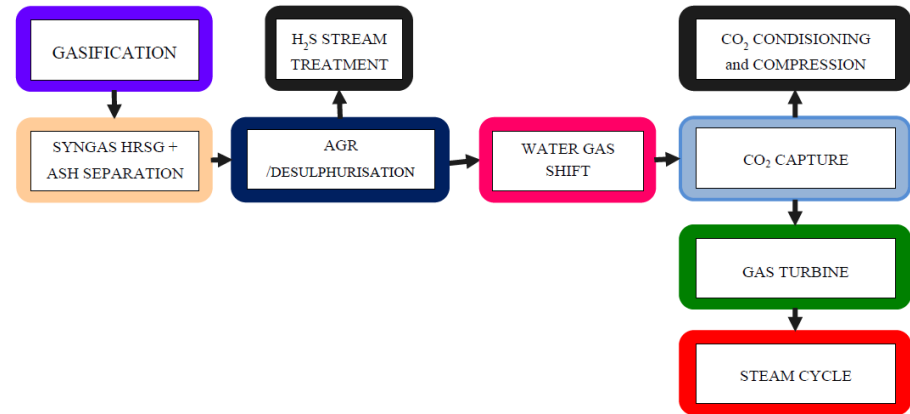

AGR configuration without CO<sub>2</sub> capture

### COMBINED H<sub>2</sub>S AND CO<sub>2</sub> CAPTURE

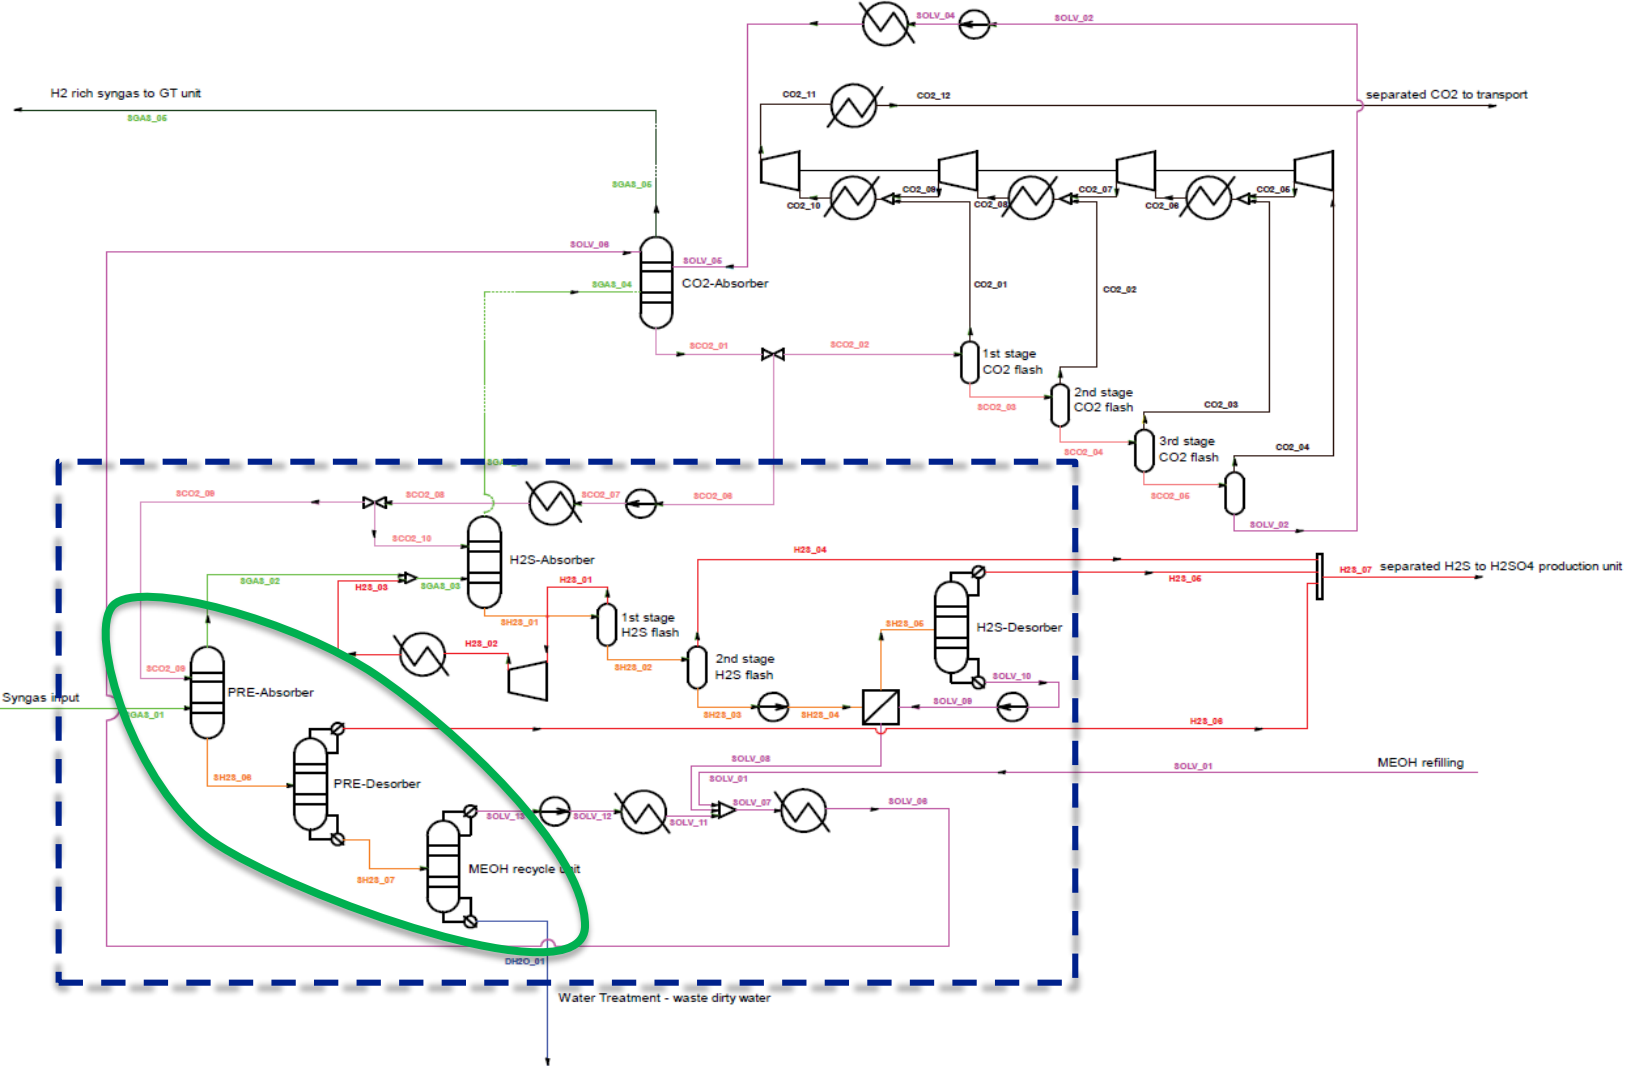

### AGR AND CO<sub>2</sub> CAPTURE – separate configuration

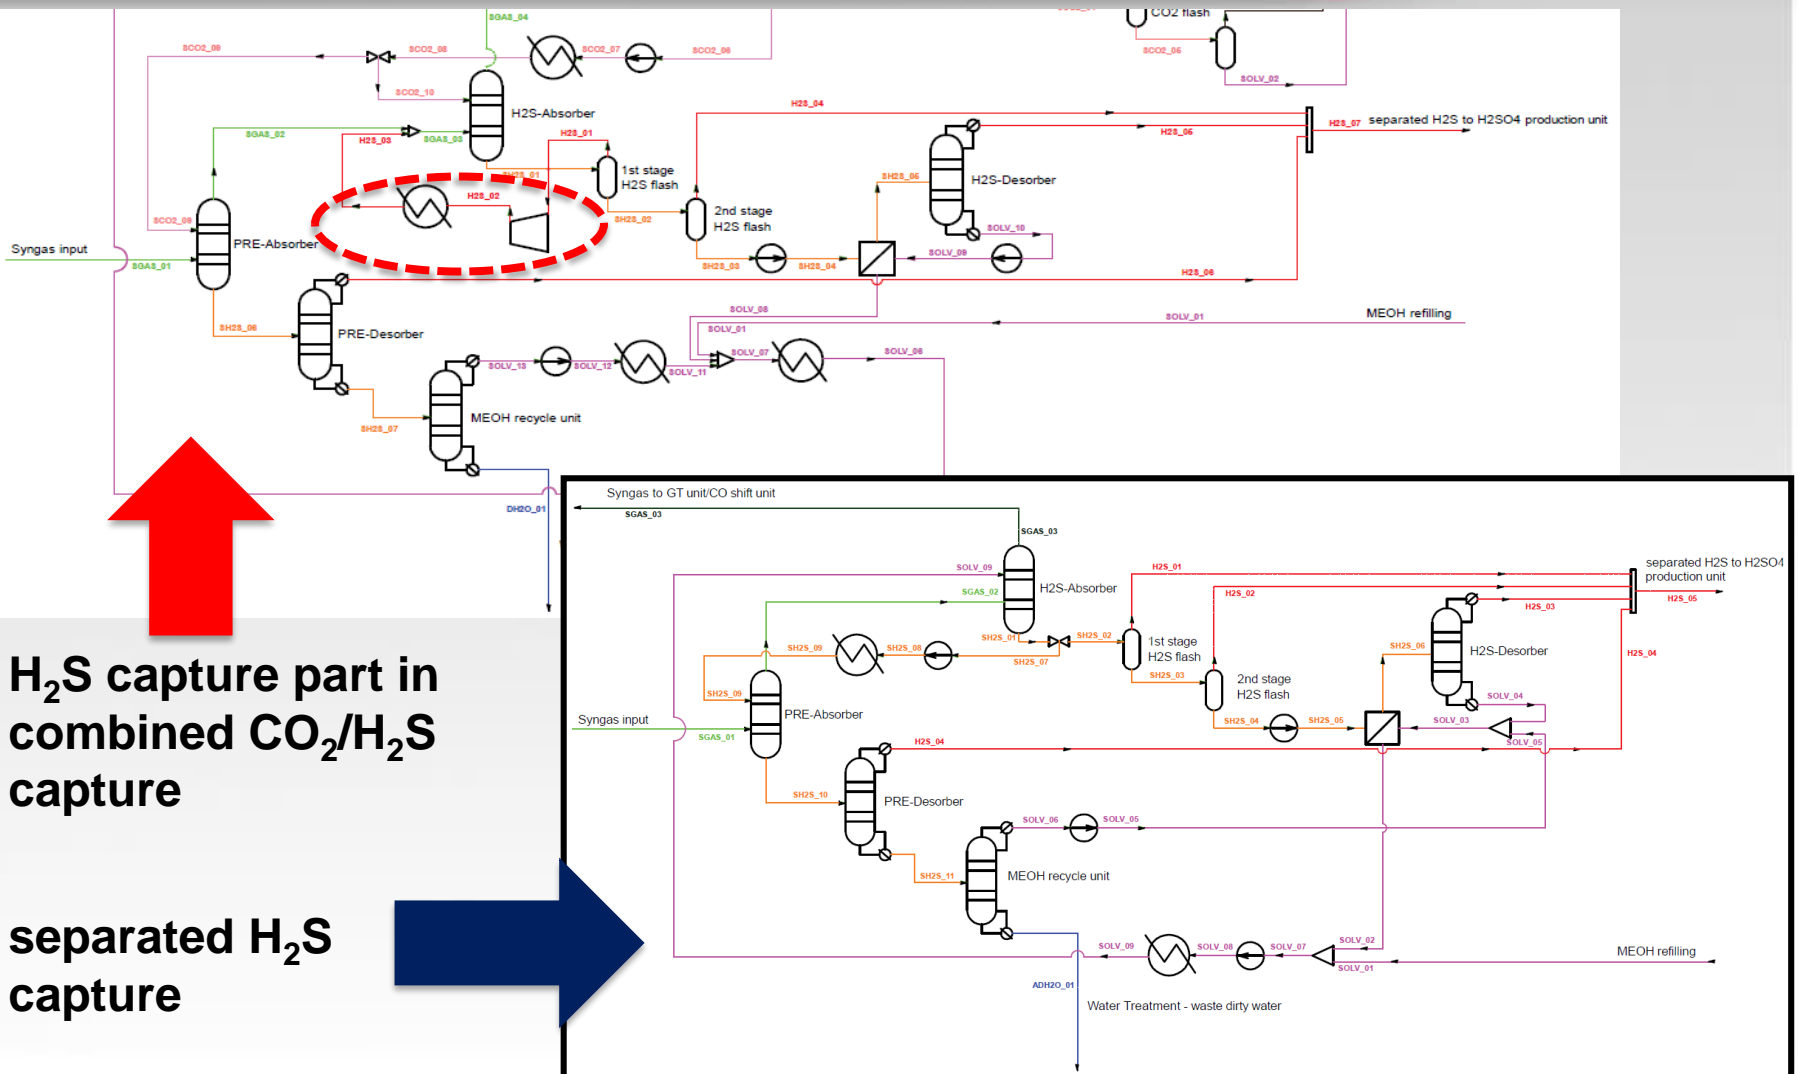

# Rectisol wash proces

## - Detail of combined H<sub>2</sub>S and CO<sub>2</sub> capture

# Rectisol wash proces

## - Comparison H<sub>2</sub>S capture (combined and separated)

H<sub>2</sub>S capture part in  
combined CO<sub>2</sub>/H<sub>2</sub>S  
capture

separated H<sub>2</sub>S  
capture

# Separated and combined H<sub>2</sub>S/CO<sub>2</sub> capture configuration – H<sub>2</sub> rich syngas composition

Parameter	Combined	AGR+CO <sub>2</sub>	
	H <sub>2</sub> S+CO <sub>2</sub>	AGR	CO <sub>2</sub>
CO [vol %]	1.0	49.0	1.1
CO <sub>2</sub> [vol %]	39.0	5.6	38.7
H <sub>2</sub> [vol %]	52.9	24.6	53.5
H <sub>2</sub> S [vol %]	0.3	0.4	0.0
CO <sub>2</sub> in H <sub>2</sub> S stream [vol %]	89	60	-
[% of all C]	<b>7.3</b>	1.6	-

# General results of comparison of separated and combined H<sub>2</sub>S/CO<sub>2</sub> capture configuration

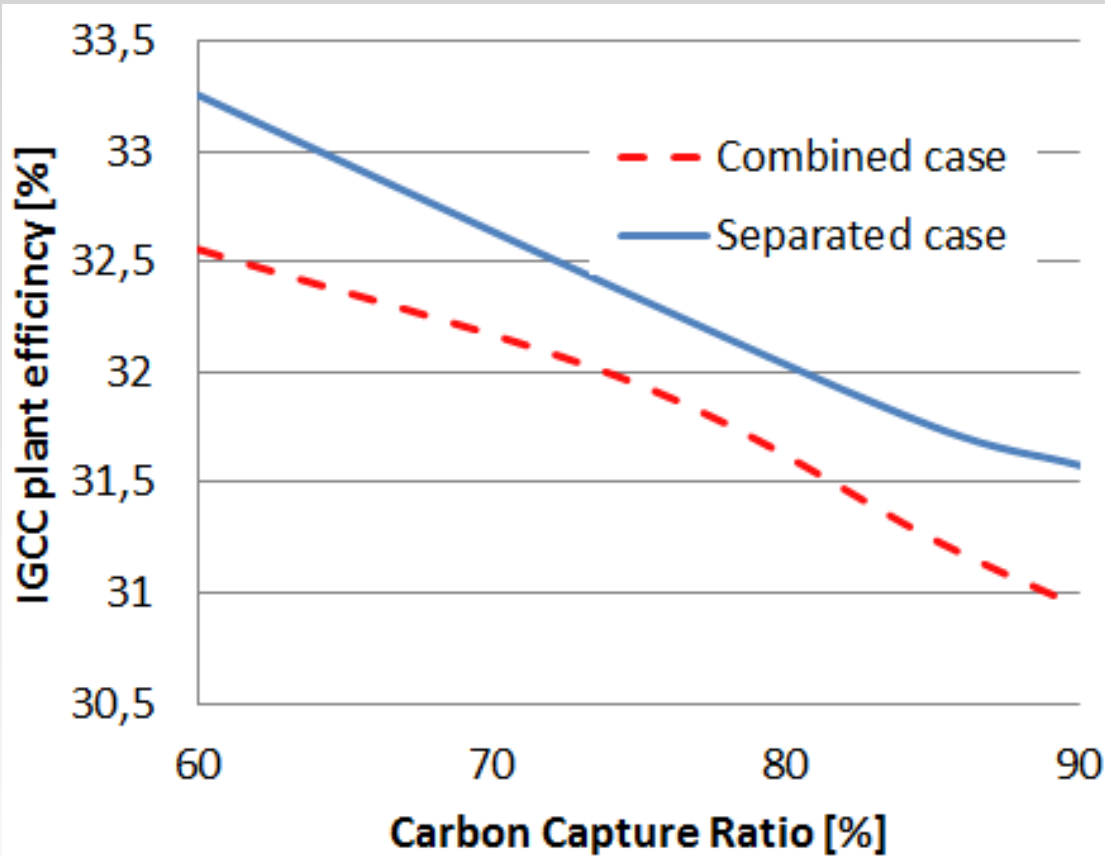

## Combined H<sub>2</sub>S and CO<sub>2</sub> capture unit

- In comparison with single system – in overall simpler, lower CAPEX etc.
- Due to lower selectivity between H<sub>2</sub>S and CO<sub>2</sub> high CO<sub>2</sub> losses in H<sub>2</sub>S offgas
  - ✓ required recirculation of part of H<sub>2</sub>S offgas to increase H<sub>2</sub>S partial pressure – higher power consumption (compressor), solvent flow
  - ✓ without recirculation 19% C loss in H<sub>2</sub>S stream
- Lower steam mass flow to WGS (requirement of reheating up syngas - to 300°C)

## AGR unit + CO<sub>2</sub> capture unit

- Low CO<sub>2</sub> loss with H<sub>2</sub>S stream without any recirculation
- Lower electricity consumption – no compressor
- Provides better control of the CO<sub>2</sub> separation process independent of AGR
- More recuperation HXs, „illogical“ temperature profile (cooling down to AGR, heat up for WGS, cooling down again)
- Higher steam mass flow to WGS (requirement of reheating up syngas - to 300°C) – by 14%

# Separated and combined H<sub>2</sub>S/CO<sub>2</sub> capture configurations – efficiency

**separated H<sub>2</sub>S  
and CO<sub>2</sub>  
capture**

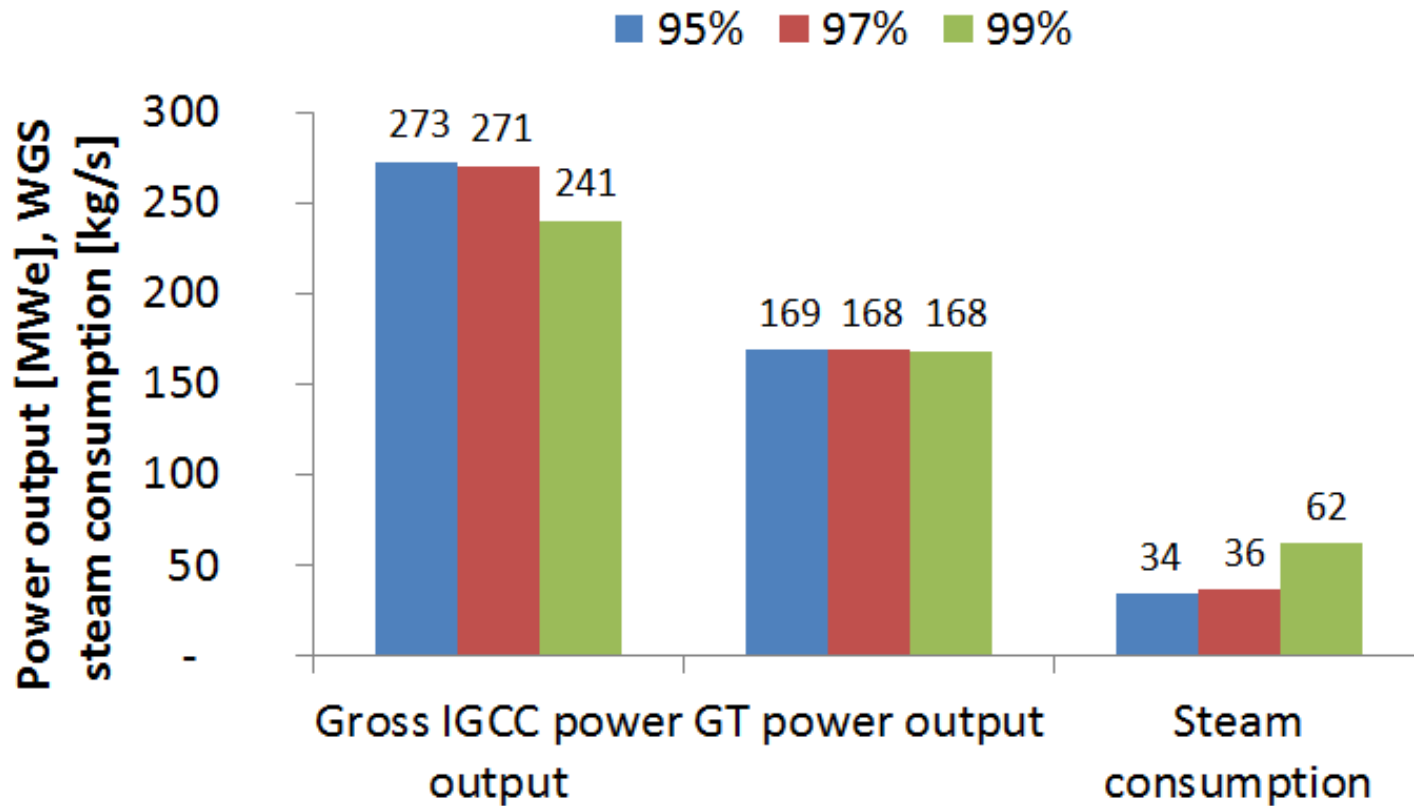

# WGS efficiency – H<sub>2</sub> rich syngas and CO<sub>2</sub> stream composition

Parameter	WGS – 95%	WGS - 97%	WGS- 99%
H <sub>2</sub> rich syngas			
CO [vol %]	2.7	1.5	0.5
CO <sub>2</sub> [vol %]	5.4	6.3	7.5
H <sub>2</sub> [vol %]	81.7	81.9	82.1
CO <sub>2</sub> capture			
CO [vol %]	0.05	0.03	0.0006
CO <sub>2</sub> [vol %]	98.3	98.5	99.2
H <sub>2</sub> [vol %]	0.5	0.45	0.02
MEOH [vol %]	0.5	0.35	0.04

# WGS efficiency

## - IGCC gross power output

# Conclusion

- Configuration with separated systems has  $\sim 0.6$  p.p. higher efficiency across the range of CCR
- Result is outcome of omitted recirculation compressor, but higher steam consumption and worse syngas heat utilization (more recuperation)
- Comparison of same phenomenon for different solvents would be interesting

THANK YOU FOR YOU ATTENTION
